

An underwater photograph of a coral reef. The foreground is dominated by a dense field of branching, yellowish-brown coral. The background shows a clear blue ocean with many small, blue fish swimming in the distance. The overall scene is bright and clear, suggesting a healthy reef environment.

constant  $\epsilon$

depth-variable  $\epsilon$

An underwater photograph of a coral reef. The foreground is dominated by a dense field of branching, yellowish-brown coral. Above the coral, the water is clear and blue, with many small, silvery fish swimming in various directions. The overall scene is bright and clear, suggesting a healthy reef environment.

## Conclusions

- Results in line w/ literature
- Need to validate
- Need better (actual) community  $\epsilon$
- Spectral imagery would be nice
